# CSE 417T Introduction to Machine Learning

Lecture 18

Instructor: Chien-Ju (CJ) Ho

### Logistics

- Homework 4 is due November 14 (Monday)
- Keep track of your own late days
  - Gradescope doesn't allow separate deadlines
  - Your submissions won't be graded if you exceed the late-day limit

- Homework 5 will be announced early next week
  - This will be our last assignment

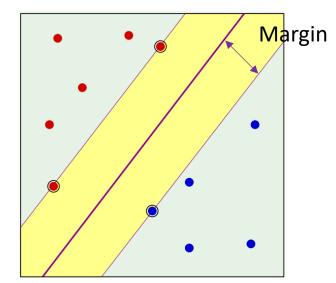

# Recap

### Support Vector Machine

• Goal: Find the max-margin linear separator that separates the data

Hard-Margin SVM (Assume data is linearly separable)

minimize
$$_{\overrightarrow{w},b}$$
  $\frac{1}{2}\overrightarrow{w}^T\overrightarrow{w}$  subject to  $y_n(\overrightarrow{w}^T\overrightarrow{x}_n+b) \geq 1, \forall n$ 

- Solvable using Quadratic Program (QP)
- Given solution  $(\vec{w}^*, b^*)$ , the learned hypothesis  $g(\vec{x}) = sign(\vec{w}^{*T}\vec{x} + b^*)$

### Support Vectors

- We call the points closest to the separator (candidate) support vectors
  - Since they support the separator

• If 
$$\vec{x}_n$$
 is a support vector,  $y_n(\vec{w}^T\vec{x}_n + b) = 1$ 

• Removing the non-support vectors will not impact the linear separator

• Leave-One-Out Cross-Validation (LOOCV) error for SVM?

• 
$$E_{LOOCV} \le \frac{\text{# support vectors}}{N}$$
 (an upper bound, could be smaller)

## Non-Separable Data

Two scenarios

- Tolerate some noise
  - Soft-Margin SVM

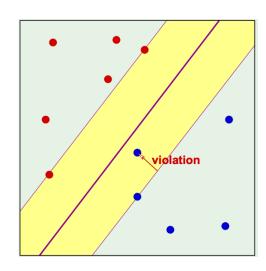

- Nonlinear transform
  - Dual formulation and kernel tricks

## Soft-Margin SVM

- For each point  $(\vec{x}_n, y_n)$ , we allow a violation  $\xi_n \geq 0$ 
  - The constraint becomes:  $y_n(\vec{w}^T\vec{x}_n + b) \ge 1 \xi_n$
  - We add a penalty for each violation : Total penalty  $C\sum_{n=1}^N \xi_n$

```
minimize \overrightarrow{w}, b, \overrightarrow{\xi} \frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} + C \sum_{n=1}^N \xi_n subject to y_n (\overrightarrow{w}^T \overrightarrow{x}_n + b) \ge 1 - \xi_n, \forall n \xi_n \ge 0, \forall n
```

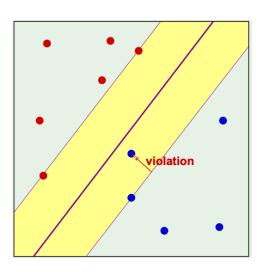

### Remarks:

- C is a hyper-parameter we can choose, e.g., using validation
  - Larger C => less tolerable to noise => smaller margin
- Soft-margin SVM is still a Quadratic Program, with efficient solvers

## Soft-Margin SVM

- For each point  $(\vec{x}_n, y_n)$ , we allow a violation  $\xi_n \geq 0$ 
  - The constraint becomes:  $y_n(\vec{w}^T\vec{x}_n + b) \ge 1 \xi_n$
  - We add a penalty for each violation : Total penalty  $C \sum_{n=1}^{N} \xi_n$

```
minimize \overline{w}, b, \overline{\xi} \frac{1}{2} \overline{w}^T \overline{w} + C \sum_{n=1}^N \xi_n subject to y_n (\overline{w}^T \vec{x}_n + b) \ge 1 - \xi_n, \forall n \xi_n \ge 0, \forall n
```

Additional Remarks: Think about  $\xi_n$ 

- $\xi_n = 0$ :  $\vec{x}_n$  is outside of the margin
- $\xi_n \in (0,1)$ :  $\vec{x}_n$  is correctly classified, but inside the margin
- $\xi_n \ge 1$ :  $\vec{x}_n$  is incorrectly classified

### What if Tolerating Small Noises Is Not Enough

Nonlinear transform

We can apply standard nonlinear transformation procedure we talked about before

In SVM, we can combine the ideas of dual formulation and kernel tricks for the transformation

This is one of the key ingredients that makes SVM powerful

# Today's Lecture

(Get prepared for heavier math today...)

The notes are not intended to be comprehensive. They should be accompanied by lectures and/or textbook. Let me know if you spot errors.

# Lagrangian Duality and Convex Optimization

[The next few slides are safe to skip for the exam, but they contain useful concepts for optimization/ML]

### Convex Optimization

Standard form of convex optimization

```
minimize_{\overrightarrow{w}} f(\overrightarrow{w})

subject to g_i(\overrightarrow{w}) \leq 0, i = 1, ..., k

h_j(\overrightarrow{w}) = 0, j = 1, ..., \ell
```

Objective

Inequality constraints

**Equality constraints** 

- Convex program
  - f and  $g_i$  are convex and  $h_i$  are affine
  - Mostly implies the existence of efficient solvers
  - Special cases
    - Linear program: f,  $g_i$ ,  $h_i$  are all affine
    - Quadratic program: f is quadratic;  $g_i$  and  $h_j$  are affine

An affine function is in the form of  $A\vec{w} + \vec{b}$ 

[Safe to Skip for the Exam]

## Lagrangian

$$\begin{array}{ll} \text{minimize}_{\overrightarrow{w}} \ f(\overrightarrow{w}) \\ \text{subject to} \quad g_i(\overrightarrow{w}) \leq 0, \qquad i = 1, ..., k \\ h_j(\overrightarrow{w}) = 0, \qquad j = 1, ..., \ell \end{array}$$

The Lagrangian of the convex program can be written as

$$L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = f(\overrightarrow{w}) + \sum_{i=1}^{k} \alpha_i g_i(\overrightarrow{w}) + \sum_{j=1}^{\ell} \beta_j h_j(\overrightarrow{w})$$

- Couple each inequality constraint  $g_i$  with a dual variable  $\alpha_i$
- Couple each equality constraint  $h_j$  with a dual variable  $\beta_j$
- Think about the following expression

$$\max_{\vec{\alpha}, \vec{\beta}; \alpha_i \ge 0} L(\vec{w}, \vec{\alpha}, \vec{\beta}) = \begin{cases} & \text{if all constraints are satisfied} \\ & \text{otherwise} \end{cases}$$

## Lagrangian

minimize
$$_{\overrightarrow{w}}$$
  $f(\overrightarrow{w})$   
subject to  $g_i(\overrightarrow{w}) \leq 0$ ,  $i = 1, ..., k$   
 $h_j(\overrightarrow{w}) = 0$ ,  $j = 1, ..., \ell$ 

The Lagrangian of the convex program can be written as

$$L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = f(\overrightarrow{w}) + \sum_{i=1}^{k} \alpha_i g_i(\overrightarrow{w}) + \sum_{j=1}^{\ell} \beta_j h_j(\overrightarrow{w})$$

- Couple each inequality constraint  $g_i$  with a dual variable  $\alpha_i$
- Couple each equality constraint  $h_i$  with a dual variable  $\beta_i$
- Think about the following expression

$$\max_{\vec{\alpha}, \vec{\beta}; \alpha_i \ge 0} L(\vec{w}, \vec{\alpha}, \vec{\beta}) = \begin{cases} f(\vec{w}), & \text{if all constraints are satisfied} \\ \infty, & \text{otherwise} \end{cases}$$

### Primal-Dual Formulation

Primal problem (the standard form of convex optimization)

$$\min_{\overrightarrow{w}} \max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \geq 0} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta})$$

• **Dual** problem

$$\max_{\vec{\alpha}, \vec{\beta}; \alpha_i \geq 0} \min_{\vec{w}} L(\vec{w}, \vec{\alpha}, \vec{\beta})$$

#### Reminders of definitions:

$$\begin{aligned} & \underset{\mathbf{w}}{\text{minimize}}_{\overrightarrow{w}} \ f(\overrightarrow{w}) \\ & \text{subject to} \quad g_i(\overrightarrow{w}) \leq 0, \qquad i = 1, ..., k \\ & \quad h_j(\overrightarrow{w}) = 0, \qquad j = 1, ..., \ell \end{aligned}$$
 
$$L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = f(\overrightarrow{w}) + \sum_{i=1}^k \alpha_i g_i(\overrightarrow{w}) + \sum_{j=1}^\ell \beta_j h_j(\overrightarrow{w})$$

• Minimax theorem [von Neumann, 1928]: For convex programs, under mild conditions,

$$\min_{\overrightarrow{w}} \max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \ge 0} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = \max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \ge 0} \min_{\overrightarrow{w}} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta})$$

[Safe to Skip for the Exam]

### Minimax Theorem [von Neumann, 1928]

$$\min_{\overrightarrow{w}} \max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \ge 0} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = \max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \ge 0} \min_{\overrightarrow{w}} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta})$$

### Remarks

- The optimal primal is the same as the optimal dual for (most) convex programs!
  - We can work on a different problem space to address the original problem
  - We'll demonstrate the usage of this in SVM, but it's also useful in other applications
- This is an important result in many areas -- e.g., it is considered as the starting point of game theory (two-player zero-sum game).
- Now we know the objectives of the optimal dual and the optimal primal are the same. How are the optimal solutions related?

## Karush-Kuhn-Tucker (KKT) Conditions

```
Lagrangian: L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = f(\overrightarrow{w}) + \sum_{i=1}^{k} \alpha_i g_i(\overrightarrow{w}) + \sum_{j=1}^{\ell} \beta_j h_j(\overrightarrow{w})
```

```
Primal: \min_{\overrightarrow{w}} \max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \geq 0} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta})
```

```
Dual: \max_{\vec{\alpha}, \vec{\beta}; \alpha_i \geq 0} \min_{\vec{w}} L(\vec{w}, \vec{\alpha}, \vec{\beta})
```

- The optimal solutions  $(\vec{w}^*, \vec{\alpha}^*, \vec{\beta}^*)$  satisfy the following conditions
  - Stationary condition:  $\nabla_{\overrightarrow{w}}L(\overrightarrow{w},\overrightarrow{\alpha}^*,\overrightarrow{\beta}^*)|_{\overrightarrow{w}=\overrightarrow{w}^*}=\overrightarrow{0}$
  - Primal feasibility:  $g_i(\vec{w}^*) \leq 0$ ;  $h_j(\vec{w}^*) = 0$  for all (i,j)
  - Dual feasibility:  $\alpha_i^* \geq 0$  for all i
  - Complementary slackness:  $\alpha_i^* g_i(\vec{w}^*) = 0$  for all i

# Short Break and Questions

#### Reminders of definitions in general convex program:

```
\begin{aligned} & & & \text{minimize}_{\overrightarrow{w}} \ f(\overrightarrow{w}) \\ & & & \text{subject to} \quad g_i(\overrightarrow{w}) \leq 0, \qquad i=1,...,k \\ & & & h_j(\overrightarrow{w}) = 0, \qquad j=1,...,\ell \end{aligned} & & L(\overrightarrow{w},\overrightarrow{\alpha},\overrightarrow{\beta}) = f(\overrightarrow{w}) + \sum_{i=1}^k \alpha_i g_i(\overrightarrow{w}) + \sum_{j=1}^\ell \beta_j h_j(\overrightarrow{w}) & & \text{Primal:} \quad \min_{\overrightarrow{w}} \max_{\overrightarrow{\alpha},\overrightarrow{\beta};\alpha_i \geq 0} L(\overrightarrow{w},\overrightarrow{\alpha},\overrightarrow{\beta}) & & \text{Dual:} \quad \max_{\overrightarrow{\alpha},\overrightarrow{\beta};\alpha_i \geq 0} L(\overrightarrow{w},\overrightarrow{\alpha},\overrightarrow{\beta}) \end{aligned}
```

### Exercise:

Remember the weight-decay regularization:

minimize
$$_{\overrightarrow{w}} E_{in}(\overrightarrow{w})$$
  
subject to  $\overrightarrow{w}^T \overrightarrow{w} \leq C$ 

And the hard-margin SVM

minimize
$$_{\overrightarrow{w}}\overrightarrow{w}^T\overrightarrow{w}$$
 subject to  $E_{in}=0$ 

Use what we talked about to write the unconstrained optimization problem.

[Safe to Skip for the Exam]

# Dual SVM

- 1. Derive the corresponding dual from hard-margin SVM
- 2. Connect optimal primal solution with optimal dual solution using KKT conditions

### Derive the Dual for Hard-Margin SVM

Hard-margin SVM

minimize
$$_{\overrightarrow{w},b}$$
  $\frac{1}{2}\overrightarrow{w}^T\overrightarrow{w}$  subject to  $y_n(\overrightarrow{w}^T\overrightarrow{x}_n+b)\geq 1, \forall n$ 

First write down the Lagrangian

#### Reminders of definitions in general convex program:

```
\begin{aligned} & & & \text{minimize}_{\overrightarrow{w}} \ f(\overrightarrow{w}) \\ & & & \text{subject to} \quad g_i(\overrightarrow{w}) \leq 0, \qquad i = 1, ..., k \\ & & & h_j(\overrightarrow{w}) = 0, \qquad j = 1, ..., \ell \end{aligned} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = f(\overrightarrow{w}) + \sum_{i=1}^k \alpha_i g_i(\overrightarrow{w}) + \sum_{j=1}^\ell \beta_j h_j(\overrightarrow{w}) Dual: \max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \geq 0} \min_{\overrightarrow{w}} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta})
```

## Derive the Dual for Hard-Margin SVM

Hard-margin SVM

$$\begin{array}{ll} \text{minimize}_{\overrightarrow{w},b} & \frac{1}{2}\overrightarrow{w}^T\overrightarrow{w} \\ \text{subject to} & y_n(\overrightarrow{w}^T\overrightarrow{x}_n+b) \geq 1, \forall n \end{array}$$

First write down the Lagrangian

$$\begin{aligned} & & & \text{minimize}_{\overrightarrow{w}} \ f(\overrightarrow{w}) \\ & & & \text{subject to} \quad g_i(\overrightarrow{w}) \leq 0, \qquad i = 1, ..., k \\ & & & h_j(\overrightarrow{w}) = 0, \qquad j = 1, ..., \ell \end{aligned}$$
 
$$L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta}) = f(\overrightarrow{w}) + \sum_{i=1}^k \alpha_i g_i(\overrightarrow{w}) + \sum_{j=1}^\ell \beta_j h_j(\overrightarrow{w})$$
 Dual: 
$$\max_{\overrightarrow{\alpha}, \overrightarrow{\beta}; \alpha_i \geq 0} \min_{\overrightarrow{w}} L(\overrightarrow{w}, \overrightarrow{\alpha}, \overrightarrow{\beta})$$

Reminders of definitions in general convex program:

$$L(\overrightarrow{w}, b, \overrightarrow{\alpha}) = \frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} + \sum_{n=1}^N \alpha_n \left( 1 - y_n (\overrightarrow{w}^T \overrightarrow{x}_n + b) \right)$$
$$= \frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} + \sum_{n=1}^N \alpha_n - \sum_{n=1}^N \alpha_n y_n (\overrightarrow{w}^T \overrightarrow{x}_n + b)$$

Dual

$$\max_{\vec{\alpha};\alpha_i \geq 0} \min_{\vec{w},b} L(\vec{w},b,\vec{\alpha})$$

- Lagrangian  $L(\vec{w}, b, \vec{\alpha}) = \frac{1}{2} \vec{w}^T \vec{w} + \sum_{n=1}^N \alpha_n \sum_{n=1}^N \alpha_n y_n (\vec{w}^T \vec{x}_n + b)$
- Dual  $\max_{\vec{\alpha};\alpha_i \geq 0} \min_{\vec{w},b} L(\vec{w},b,\vec{\alpha})$  (the variables in the dual are  $\vec{\alpha}$ )
- Derivations
  - Express  $\vec{w}$  and  $\vec{b}$  using  $\vec{\alpha}$  in the dual objective  $\min_{\vec{w}, \vec{b}} L(\vec{w}, \vec{b}, \vec{\alpha})$ 
    - Solve for  $\nabla_{\overrightarrow{w},b}L(\overrightarrow{w},b,\overrightarrow{\alpha})=0$

- Lagrangian  $L(\vec{w}, b, \vec{\alpha}) = \frac{1}{2} \vec{w}^T \vec{w} + \sum_{n=1}^N \alpha_n \sum_{n=1}^N \alpha_n y_n (\vec{w}^T \vec{x}_n + b)$
- Dual  $\max_{\vec{\alpha};\alpha_i \geq 0} \min_{\vec{w},b} L(\vec{w},b,\vec{\alpha})$  (the variables in the dual are  $\vec{\alpha}$ )
- Derivations
  - Express  $\vec{w}$  and  $\vec{b}$  using  $\vec{\alpha}$  in the dual objective  $\min_{\vec{w}, \vec{b}} L(\vec{w}, \vec{b}, \vec{\alpha})$ 
    - Solve for  $\nabla_{\overrightarrow{w},b}L(\overrightarrow{w},b,\overrightarrow{\alpha})=0$ 
      - $\nabla_{\overrightarrow{w}}L(\overrightarrow{w}, b, \overrightarrow{\alpha}) = 0 \Rightarrow \overrightarrow{w} \sum_{n=1}^{N} \alpha_n y_n \overrightarrow{x}_n = 0 \Rightarrow \overrightarrow{w} = \sum_{n=1}^{N} \alpha_n y_n \overrightarrow{x}_n$
      - $\nabla_b L(\vec{w}, b, \vec{\alpha}) = 0 \Rightarrow \sum_{n=1}^N \alpha_n y_n = 0$
    - Plug  $\vec{w} = \sum_{n=1}^{N} \alpha_n y_n \vec{x}_n$  into  $L(\vec{w}, b, \vec{\alpha})$ 
      - $\frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} = \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \overrightarrow{x}_n^T \overrightarrow{x}_m$
      - $\sum_{n=1}^{N} \alpha_n y_n (\vec{w}^T \vec{x} + b) = \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \vec{x}_n^T \vec{x}_m + b \sum_{n=1}^{N} \alpha_n y_n$
  - $\min_{\overrightarrow{w},b} L(\overrightarrow{w},b,\overrightarrow{\alpha}) = \sum_{n=1}^{N} \alpha_n \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \overrightarrow{x}_n^T \overrightarrow{x}_m$

• Lagrangian 
$$L(\vec{w}, b, \vec{\alpha}) = \frac{1}{2} \vec{w}^T \vec{w} + \sum_{n=1}^N \alpha_n - \sum_{n=1}^N \alpha_n y_n (\vec{w}^T \vec{x}_n + b)$$

• Dual  $\max_{\vec{\alpha};\alpha_i \geq 0} \min_{\vec{w},b} L(\vec{w},b,\vec{\alpha})$  (the variables in the dual are  $\vec{\alpha}$ )

### **Dual Constraint**

- Derivations
  - Express  $\vec{w}$  and  $\vec{b}$  using  $\vec{\alpha}$  in the dual objective  $\min_{\vec{w}, \vec{b}} L(\vec{w}, \vec{b}, \vec{\alpha})$ 
    - Solve for  $\nabla_{\overrightarrow{w},b}L(\overrightarrow{w},b,\overrightarrow{\alpha})=0$

• 
$$\nabla_{\overrightarrow{w}}L(\overrightarrow{w}, \overrightarrow{b}, \overrightarrow{\alpha}) = 0 \Rightarrow \overrightarrow{w} - \sum_{n=1}^{N} \alpha_n y_n \overrightarrow{x}_n = 0 \Rightarrow \overrightarrow{w} = \sum_{n=1}^{N} \alpha_n y_n \overrightarrow{x}_n$$

• 
$$\nabla_b L(\vec{w}, b, \vec{\alpha}) = 0 \Rightarrow \sum_{n=1}^N \alpha_n y_n = 0$$

**Dual Constraint** 

• Plug  $\vec{w} = \sum_{n=1}^{N} \alpha_n y_n \vec{x}_n$  into  $L(\vec{w}, b, \vec{\alpha})$ 

• 
$$\frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} = \frac{1}{2} \sum_{n=1}^N \sum_{m=1}^N \alpha_n \alpha_m y_n y_m \overrightarrow{x}_n^T \overrightarrow{x}_m$$

• 
$$\sum_{n=1}^{N} \alpha_n y_n (\vec{w}^T \vec{x} + b) = \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \vec{x}_n^T \vec{x}_m + b \sum_{n=1}^{N} \alpha_n y_n$$

• 
$$\min_{\overrightarrow{w},b} L(\overrightarrow{w},b,\overrightarrow{\alpha}) = \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \overrightarrow{x}_n^T \overrightarrow{x}_m$$

**Dual Objective** 

### **Dual SVM**

Dual of the hard-margin SVM

$$\begin{array}{l} \text{maximize}_{\overrightarrow{\alpha}} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \vec{x}_n^T \vec{x}_m \\ \text{subject to} \quad \sum_{n=1}^{N} \alpha_n y_n = 0 \\ \alpha_n \geq 0, \forall n \end{array}$$

• The dual is still a Quadratic Program, with efficient solvers to find  $\vec{\alpha}^*$ 

- We know that the objective of the optimal dual is the same as the optimal primal
- Say we obtain  $\vec{\alpha}^*$ , how do we recover the optimal primal  $(\vec{w}^*, b^*)$ ?
  - Apply KKT conditions

# Recover $(\vec{w}^*, b^*)$ from $\vec{\alpha}^*$

- Using stationary conditions in KKT
  - $\nabla_{\overrightarrow{w}}L(\overrightarrow{w},b^*,\overrightarrow{\alpha}^*)|_{\overrightarrow{w}=\overrightarrow{w}^*}=\overrightarrow{0}$
  - $\vec{w}^* = \sum_{n=1}^N \alpha_n^* y_n \vec{x}_n$

  - Since  $\alpha_n^* \geq 0$ , we can rewrite  $\vec{w}^* = \sum_{\alpha_n^* \geq 0} \alpha_n^* y_n \vec{x}_n$
- Using complementary slackness in KKT
- Note that  $\vec{w}^T \vec{x} = \vec{x}^T \vec{w}$ .
- I swapped the order to avoid two superscripts in  $\vec{w}$

 $L(\vec{w}, b, \vec{\alpha}) = \frac{1}{2} \vec{w}^T \vec{w} + \sum_{n=1}^N \alpha_n - \sum_{n=1}^N \alpha_n y_n (\vec{w}^T \vec{x}_n + b)$ 

- $\alpha_n^* (1 y_n(\vec{x}_n^T \vec{w}^* + b^*)) = 0$
- Find a  $\alpha_n^* > 0$ , we have  $y_n(\vec{x}_n^T \vec{w}^* + b^*) = 1$
- Since  $y_n \in \{+1, -1\}$ , we have  $\vec{x}_n^T \vec{w}^* + b^* = y_n$
- Therefore,
  - $b^* = y_n \vec{x}_n^T \vec{w}^*$  (with  $\vec{w}^* = \sum_{\alpha_n^* > 0} \alpha_n^* y_n \vec{x}_n$ )

# Recover $(\overrightarrow{w}^*, b^*)$ from $\overrightarrow{\alpha}^*$

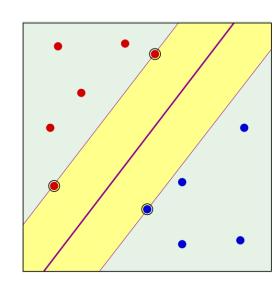

- Solve the dual and find  $\vec{\alpha}^*$ 
  - $\vec{w}^* = \sum_{\alpha_n^* > 0} \alpha_n^* y_n \vec{x}_n$
  - $b^* = y_n \vec{x}_n^T \vec{w}^*$  for some  $\alpha_n^* > 0$
  - $g(\vec{x}) = sign(\vec{w}^*^T \vec{x} + b^*)$

- What does  $\alpha_n^* > 0$  imply?
  - Complementary slackness  $\alpha_n^* (1 y_n(\vec{x}_n^T \vec{w}^* + b^*)) = 0$
  - $\alpha_n^* > 0 \Rightarrow y_n(\vec{x}_n^T \vec{w}^* + b^*) = 1$
- $\alpha_n^* > 0 \Rightarrow (\vec{x}_n, y_n)$  is the support vector
  - $\vec{w}^* = \sum_{\alpha_n^* > 0} \alpha_n^* y_n \vec{x}_n$  is the linear combination of support vectors!
  - Support vector machine!

### Support Vectors

- Primal point of view
  - We call the points closest to the separator (candidate) support vectors
  - They are the points that the equality holds in the constraints
    - If  $\vec{x}_n$  is a support vector,  $y_n(\vec{w}^T\vec{x}_n + b) = 1$
  - Removing the non-support vectors will not impact the linear separator
- Dual point of view
  - If  $\alpha_n^* > 0 \Rightarrow (\vec{x}_n, y_n)$  is the support vector
  - The optimal separator  $(\overrightarrow{w}^*, b^*)$ 
    - $\vec{w}^* = \sum_{\alpha_n^* > 0} \alpha_n^* y_n \vec{x}_n$
    - $b^* = y_n \vec{x}_n^T \vec{w}^*$  for some  $\alpha_n^* > 0$
  - $(\vec{w}^*, b^*)$  can be defined by "support vectors"
    - Support vector machine!

# Nonlinear Transform and Kernel Tricks

### Primal-Dual Formulations of Hard-Margin SVM

### Primal

minimize
$$_{\overrightarrow{w},b}$$
  $\frac{1}{2}\overrightarrow{w}^T\overrightarrow{w}$  subject to  $y_n(\overrightarrow{w}^T\overrightarrow{x}_n+b)\geq 1, \forall n$ 

### Given optimal $\vec{\alpha}^*$ :

- $\vec{w}^* = \sum_{\alpha_n^* > 0} \alpha_n^* y_n \vec{x}_n$
- Find a  $\alpha_n^* > 0$ ,  $b^* = y_n \vec{x}_n^T \vec{w}^*$

### Dual

maximize 
$$\vec{\alpha} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \vec{x}_n^T \vec{x}_m$$
 subject to  $\sum_{n=1}^{N} \alpha_n y_n = 0$   $\alpha_n \ge 0, \forall n$ 

- Both can be efficiently solved using QP solvers
- We can infer the solution from one to the other

## Nonlinear Transform: $\vec{z} = \Phi(\vec{x})$

### Primal

```
minimize_{\overrightarrow{w},b} \frac{1}{2}\overrightarrow{w}^T\overrightarrow{w} subject to y_n(\overrightarrow{w}^T\overrightarrow{z}_n+b) \geq 1, \forall n
```

Involves changing  $\vec{w}$  and  $\vec{z}$ . The computation grows as the dimension of the  $\vec{z}$  space grows

Dual

```
maximize \vec{\alpha} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \vec{z}_n^T \vec{z}_m subject to \sum_{n=1}^{N} \alpha_n y_n = 0 \alpha_n \ge 0, \forall n
```

The only difference is from calculating  $\vec{x}_n^T \vec{x}_m$  to  $\vec{z}_n^T \vec{z}_m$ 

- Intuition: If we can find an efficient way to calculate  $\vec{z}_n^T \vec{z}_m$ , we can derive the optimal dual to infer the optimal primal.
  - Doing nonlinear transform without sacrificing much about computation.

## Example: 2<sup>nd</sup> Order Polynomial Transform

- $\bullet \ \vec{x} = (x_1, x_2)$
- 2<sup>nd</sup> order polynomial transform

• 
$$\vec{z} = \Phi_2(\vec{x}) = (1, \sqrt{2}x_1, \sqrt{2}x_2, \sqrt{2}x_1, x_2, x_1^2, x_2^2)$$

$$\vec{z}^T \vec{z}' = 1 + 2x_1 x_1' + 2x_2 x_2' + 2x_1 x_1' x_2 x_2' + x_1^2 {x_1'}^2 + x_2^2 {x_2'}^2$$

$$= 1 + 2x_1 x_1' + 2x_2 x_2' + 2x_1 x_1' x_2 x_2' + (x_1 x_1')^2 + (x_2 x_2')^2$$

$$= (1 + x_1 x_1' + x_2 x_2')^2$$

$$= (1 + \vec{x}^T \vec{x}')^2$$

• We can calculate  $\vec{z}^T \vec{z}'$  from the operation in the  $\vec{x}$  space!

We define the transform slight differently

• The  $\sqrt{2}$  and the initial 1 are not in the original transform, but we include them for convenience.

### Kernel Functions

- Define kernel function  $K_{\Phi}(\vec{x}, \vec{x}') = \Phi(\vec{x})^T \Phi(\vec{x}')$ 
  - The similarity of two vectors in the projected space
- Goal: Compute  $K_{\Phi}(\vec{x}, \vec{x}')$  without transforming  $\vec{x}$  and  $\vec{x}'$

• Why? This enables us to operate in the higher dimensional space without really worrying about the computational overhead.

### Kernel Trick: Utilize Dual and Kernel Functions

The dual with nonlinear transform

maximize 
$$\vec{\alpha} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \vec{z}_n^T \vec{z}_m$$
 subject to  $\sum_{n=1}^{N} \alpha_n y_n = 0$   $\alpha_n \geq 0, \forall n$ 

• Plug in the kernel function  $K_{\Phi}(\vec{x}, \vec{x}') = \Phi(\vec{x})^T \Phi(\vec{x}')$ 

```
\begin{aligned} & \text{maximize}_{\overrightarrow{\alpha}} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m K_{\Phi}(\vec{x}_n, \vec{x}_m) \\ & \text{subject to} \quad \sum_{n=1}^{N} \alpha_n y_n = 0 \\ & \alpha_n \geq 0, \forall n \end{aligned}
```

- If the kernel can be computed efficiently, we can solve  $\vec{\alpha}^*$  efficiently.
- With kernel tricks, we can avoid the dependency on the dimension of  $\vec{z}$

## Recover $(\overrightarrow{w}^*, b^*)$ from $\overrightarrow{\alpha}^*$ with Kernel Tricks

- Note that  $\vec{\alpha}^*$  is solved in the  $\vec{z}$  space
  - $\vec{w}^* = \sum_{\alpha_n^* > 0} \alpha_n^* y_n \Phi(\vec{x}_n)$
  - Find a  $\alpha_n^* > 0$ ,  $b^* = y_n \overrightarrow{w}^{*T} \Phi(\overrightarrow{x}_n)$
  - We want to avoid the transformation!
- Let's look at the hypothesis  $g(\vec{x}) = sign(\vec{w}^{*T}\Phi(\vec{x}) + b^{*})$

$$\vec{w}^{*T} \Phi(\vec{x}) = \left(\sum_{\alpha_n^* > 0} \alpha_n^* y_n \Phi(\vec{x}_n)\right)^T \Phi(\vec{x})$$

$$= \sum_{\alpha_n^* > 0} \alpha_n^* y_n \Phi(\vec{x}_n)^T \Phi(\vec{x})$$

$$= \sum_{\alpha_n^* > 0} \alpha_n^* y_n K(\vec{x}_n, \vec{x})$$

$$b^* = y_n - \vec{w}^{*T} \Phi(\vec{x}_n) \text{ (for some } n \text{ that } \alpha_n^* > 0)$$

$$= y_n - \left(\sum_{\alpha_m^* > 0} \alpha_m^* y_m \Phi(\vec{x}_m)\right)^T \Phi(\vec{x}_n)$$

$$= y_n - \sum_{\alpha_m^* > 0} \alpha_m^* y_m K(\vec{x}_m, \vec{x}_n)$$

- Utilize support vectors to make predictions on  $\vec{x}$ 
  - Still can be computed in the  $\vec{x}$  space!

## Kernel Functions

 $K_{\Phi}(\vec{x}, \vec{x}')$ : Inner products of two points  $\Phi(\vec{x})^T \Phi(\vec{x}')$  in the transformed space Similarity of two points  $\Phi(\vec{x})$  and  $\Phi(\vec{x}')$  in the transformed space

## Polynomial Kernel

Kernel  $K(\vec{x}, \vec{x}') = \Phi(\vec{x})^T \Phi(\vec{x}')$ 

- Example in the last lecture:  $2^{nd}$  order polynomial for 2-d  $\vec{x}$ 
  - $\vec{x} = (x_1, x_2)$
  - $\vec{z} = \Phi_2(\vec{x}) = (1, \sqrt{2}x_1, \sqrt{2}x_2, \sqrt{2}x_1, x_2, x_1^2, x_2^2)$
  - $\vec{z}' = \Phi_2(\vec{x}') = (1, \sqrt{2}x_1', \sqrt{2}x_2', \sqrt{2}x_1'x_2', x_1'^2, x_2'^2)$

• 
$$\vec{z}^T \vec{z}' = 1 + 2x_1 x_1' + 2x_2 x_2' + 2x_1 x_1' x_2 x_2' + (x_1 x_1')^2 + (x_2 x_2')^2$$
  
=  $(1 + x_1 x_1' + x_2 x_2')^2$   
=  $(1 + \vec{x}^T \vec{x}')^2$ 

- General 2<sup>nd</sup> order polynomial
  - $\vec{x} = (x_1, x_2, ..., x_d)$
  - $K_{\Phi_2}(\vec{x}, \vec{x}') = (1 + \vec{x}^T \vec{x}')^2$ =  $(1 + x_1 x_1' + x_2 x_2' + \dots + x_d x_d')^2$

## Polynomial Kernel

• 
$$\vec{x} = (x_1, x_2, ..., x_d)$$

### General form of polynomial kernel:

$$K(\vec{x}, \vec{x}') = (a\vec{x}^T\vec{x}' + b)^Q$$

- 2<sup>nd</sup> order polynomial kernel  $K_{\Phi_2}(\vec{x}, \vec{x}') = (1 + \vec{x}^T \vec{x}')^2$
- Q-th order Polynomial kernel  $K_{\Phi_Q}(\vec{x}, \vec{x}') = (1 + \vec{x}^T \vec{x}')^Q$  $= (1 + x_1 x_1' + \dots + x_d x_d')^Q$
- Computational complexity
  - Dimension of  $\Phi_Q(\vec{x})$ :  $\binom{Q+d}{Q}$
  - Direct computation of  $\Phi_Q(\vec{x})^T \Phi_Q(\vec{x}')$ :  $O\left(\begin{pmatrix} Q+d \\ Q \end{pmatrix}\right)$
  - Computation through kernel  $K_{\Phi_O}(\vec{x}, \vec{x}')$ : O(d)

## We Only Need $\vec{z}$ Space to Exist

- In the discussion of polynomial kernels
  - We have a target transformation in mind
  - We want to find a corresponding kernel function
- In fact, as long as  $K(\vec{x}, \vec{x}')$  is an inner product in some  $\vec{z}$  space, we are good
  - Just plug in the kernel in the dual formulation
  - We obtain a linear separator in the corresponding  $\vec{z}$  space

```
maximize \vec{\alpha} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m K_{\Phi}(\vec{x}_n, \vec{x}_m) subject to \sum_{n=1}^{N} \alpha_n y_n = 0 \alpha_n \ge 0, \forall n
```

### Gaussian RBF Kernel

- $K(\vec{x}, \vec{x}') = e^{-\gamma \|\vec{x} \vec{x}'\|^2}$
- What's the corresponding  $\vec{z}$  space? (What is  $\Phi$  such that  $\Phi(\vec{x})^T \Phi(\vec{x}') = e^{-\gamma ||\vec{x} \vec{x}'||^2}$ )
  - For illustrative purpose, make  $\vec{x} = x$  be 1 dimensional and y = 1

• 
$$K(\vec{x}, \vec{x}') = e^{-(x-x')^2}$$
  
 $= e^{-x^2 + 2xx' - x'^2}$   
 $= e^{-x^2} e^{-x'^2} e^{2xx'}$   
 $= e^{-x^2} e^{-x'^2} \sum_{k=0}^{\infty} \frac{(2xx')^k}{k!}$   
 $= \sum_{k=0}^{\infty} e^{-x^2} \sqrt{\frac{2^k}{k!}} x^k e^{-x'^2} \sqrt{\frac{2^k}{k!}} x'^k$ 

Taylor expansion:  $e^{2xx'} = \sum_{k=0}^{\infty} \frac{(2xx')^k}{k!}$ 

• The corresponding  $\Phi(x) = e^{-x^2} \left( 1, \sqrt{\frac{2}{1}} x, \sqrt{\frac{2^2}{2!}} x^2, \dots \right)$ 

### Gaussian RBF Kernel

- $K(\vec{x}, \vec{x}') = e^{-\gamma \|\vec{x} \vec{x}'\|^2}$
- The corresponding transform in 1-dim input  $\vec{x} = x$

• 
$$\Phi(x) = e^{-x^2} \left( 1, \sqrt{\frac{2}{1}} x, \sqrt{\frac{2^2}{2!}} x^2, \dots \right)$$

- $K(\vec{x}, \vec{x}')$  is the inner product of two vectors in an infinite dimensional space!
- When we plug in  $K(\vec{x}, \vec{x}')$  in dual SVM
  - We are finding the max-margin separator in an infinite dimensional space
  - Seems to introduce infinite generalization error?
    - Maximizing margin help mitigate this issue
    - The number of support vectors provides indicators on the generalization

## Design Your Own Kernel? [Safe to Skip]

• Say we design a kernel function, how do we know whether it is valid, i.e., whether there is a corresponding  $\vec{z}$  space?

- Mercer's condition (See discussion in LFD 8.3.2)
  - Kernel matrix

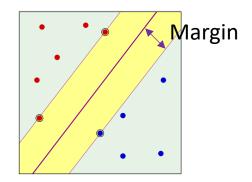

$$\left[ egin{array}{ccccc} K(\mathbf{x}_1,\mathbf{x}_1) & K(\mathbf{x}_1,\mathbf{x}_2) & \dots & K(\mathbf{x}_1,\mathbf{x}_N) \ K(\mathbf{x}_2,\mathbf{x}_1) & K(\mathbf{x}_2,\mathbf{x}_2) & \dots & K(\mathbf{x}_2,\mathbf{x}_N) \ & \dots & & \dots & & \dots \ K(\mathbf{x}_N,\mathbf{x}_1) & K(\mathbf{x}_N,\mathbf{x}_2) & \dots & K(\mathbf{x}_N,\mathbf{x}_N) \end{array} 
ight]$$

•  $K(\vec{x}, \vec{x}')$  is a valid kernel if and only if the kernel matrix is always symmetric positive semi-definite for any  $\vec{x}_1, \dots, \vec{x}^N$ 

### Summary of What We Talked About So Far

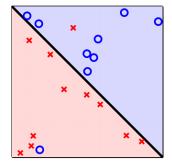

### **Hard-Margin SVM (Separable Data)**

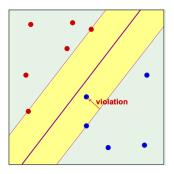

minimize
$$_{\overrightarrow{w},b}$$
  $\frac{1}{2}\overrightarrow{w}^T\overrightarrow{w}$   
subject to  $y_n(\overrightarrow{w}^T\overrightarrow{x}_n+b) \ge 1, \forall n$ 

### **Soft-Margin SVM (Tolerate Noise)**

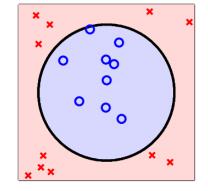

minimize 
$$\overrightarrow{w}, b, \overrightarrow{\xi}$$
  $\frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} + C \sum_{n=1}^N \xi_n$   
subject to  $y_n (\overrightarrow{w}^T \overrightarrow{x}_n + b) \ge 1 - \xi_n, \forall n$   
 $\xi_n \ge 0, \forall n$ 

### **Kernel Formulation of Hard-Margin SVM**

maximize 
$$\alpha \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m K_{\Phi}(\vec{x}_n, \vec{x}_m)$$
 subject to  $\sum_{n=1}^{N} \alpha_n y_n = 0$   $\alpha_n \ge 0, \forall n$ 

### Kernel Version of Soft-Margin SVM

Soft-Margin SVM

```
minimize \overrightarrow{w}, b, \overrightarrow{\xi} = \frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} + C \sum_{n=1}^N \xi_n

subject to y_n(\overrightarrow{w}^T \overrightarrow{x}_n + b) \ge 1 - \xi_n, \forall n

\xi_n \ge 0, \forall n
```

Kernel Version of Soft-Margin SVM

```
\begin{aligned} & \text{maximize}_{\overrightarrow{\alpha}} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m K_{\Phi}(\vec{x}_n, \vec{x}_m) \\ & \text{subject to} \quad \sum_{n=1}^{N} \alpha_n y_n = 0 \\ & 0 \leq \alpha_n \leq \textit{C}, \forall n \end{aligned}
```

- It can be obtained by similar procedure as hard-margin version
- We can obtain the same relationship between  $\vec{\alpha}^*$  and  $(\vec{w}^*, b^*)$

### Interpretation of Support Vectors

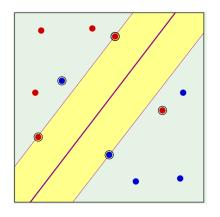

- $\alpha_n^* > 0 \Rightarrow (\vec{x}_n, y_n)$  is a support vector
  - $y_n(\overrightarrow{w}^*\overrightarrow{x}_n + b^*) = 1 \xi_n$
- Utilizing complementary slackness
  - When  $0 < \alpha_n^* < C$ 
    - $\xi_n = 0$
    - $y_n(\vec{w}^{*T}\vec{x}_n + b^*) = 1$
    - $(\vec{x}_n, y_n)$  is a "margin" support vector
  - When  $\alpha_n^* = C$ 
    - $\xi_n > 0$
    - $y_n(\vec{w}^{*T}\vec{x}_n + b^*) < 1$
    - $(\vec{x}_n, y_n)$  is a "non-margin" support vector

```
minimize \overrightarrow{w}, b, \overrightarrow{\xi} = \frac{1}{2} \overrightarrow{w}^T \overrightarrow{w} + C \sum_{n=1}^N \xi_n

subject to y_n (\overrightarrow{w}^T \overrightarrow{x}_n + b) \ge 1 - \xi_n, \forall n

\xi_n \ge 0, \forall n
```

maximize 
$$\vec{\alpha} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m K_{\Phi}(\vec{x}_n, \vec{x}_m)$$
  
subject to  $\sum_{n=1}^{N} \alpha_n y_n = 0$   
 $0 \le \alpha_n \le C$ ,  $\forall n$ 

### Another Look at Primal vs. Dual SVM

Primal

minimize
$$_{\overrightarrow{w},b}$$
  $\frac{1}{2}\overrightarrow{w}^T\overrightarrow{w}$  subject to  $y_n(\overrightarrow{w}^T\overrightarrow{z}_n+b)\geq 1, \forall n$ 

Learned hypothesis

• 
$$g(\vec{x}) = sign(\vec{w}^{*T}\Phi(\vec{x}) + b^{*})$$

Dual

$$\begin{split} \text{maximize}_{\overrightarrow{\alpha}} \sum_{n=1}^{N} \alpha_n - \frac{1}{2} \sum_{n=1}^{N} \sum_{m=1}^{N} \alpha_n \alpha_m y_n y_m \vec{\pmb{z}}_n^T \vec{\pmb{z}}_m \\ \text{subject to} \quad \sum_{n=1}^{N} \alpha_n y_n = 0 \\ \alpha_n \geq 0, \forall n \end{split}$$

Learned hypothesis

• 
$$g(\vec{x}) = sign(\sum_{\alpha_n^* > 0} \alpha_n^* y_n K(\vec{x}_n, \vec{x}) + b^*))$$

•  $(\alpha_n^* > 0 \Rightarrow \vec{x}_n \text{ is a support vector})$ 

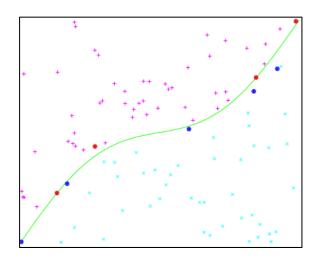

- Primal view of SVM (parametric)
  - We are learning the weights for SVM, i.e.,  $(\vec{w}^*, b^*)$
  - When using RBF Kernel, there are infinite number of parameters
- Dual kernel view of SVM (nonparametric)
  - We are learning the support vectors, and use those for prediction

### Kernel SVM and Radial Basis Functions

### Kernel SVM

• 
$$g(\vec{x}) = sign(\sum_{\alpha_n^* > 0} \alpha_n^* y_n K(\vec{x}_n, \vec{x}) + b^*))$$

• Use support vectors to characterize a hypothesis

Radial Basis Functions

• 
$$h(\vec{x}) = sign\left(\sum_{k=1}^{K} w_k \phi\left(\frac{\|\vec{x} - \vec{\mu}_k\|}{r}\right)\right)$$

• Use cluster centers to characterize a hypothesis
